### Robot Software Architectures & Planning

- Temporal Decomposition
- Main Architecture Types
  - Deliberative.
  - Planning Intro
  - Reactive.
  - Behaviour-based.
  - Hybrid.
- Examples
  - Shakey Example.
  - ROS Example.

<b>Lecturer:</b>	Damien Jade Duff
<b>Email:</b>	<a href="mailto:djduff@itu.edu.tr">djduff@itu.edu.tr</a>
<b>Office:</b>	EEBF 2316
<b>Schedule:</b>	<a href="http://djduff.net/my-schedule">http://djduff.net/my-schedule</a>
<b>Coordination:</b>	<a href="http://ninova.itu.edu.tr/">http://ninova.itu.edu.tr/</a>

Considerably adapted from work by Dr. Sanem Sariel-Talay

# What is a Robot Architecture

The organisation of a robot (software) control system.

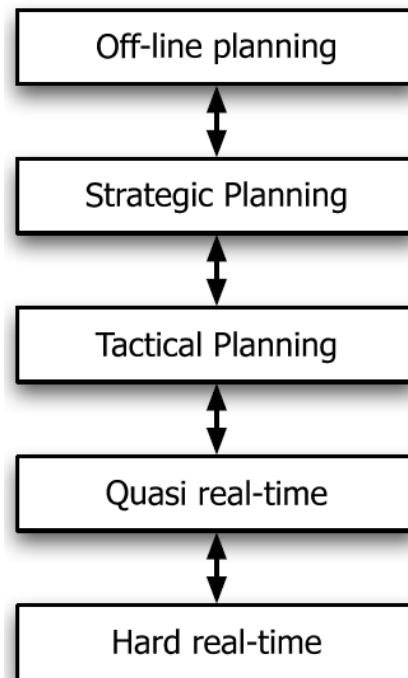

E.g.:

- How components coordinate (e.g. localisation and navigation).
- Conceptual approach to achieving tasks.
- ...

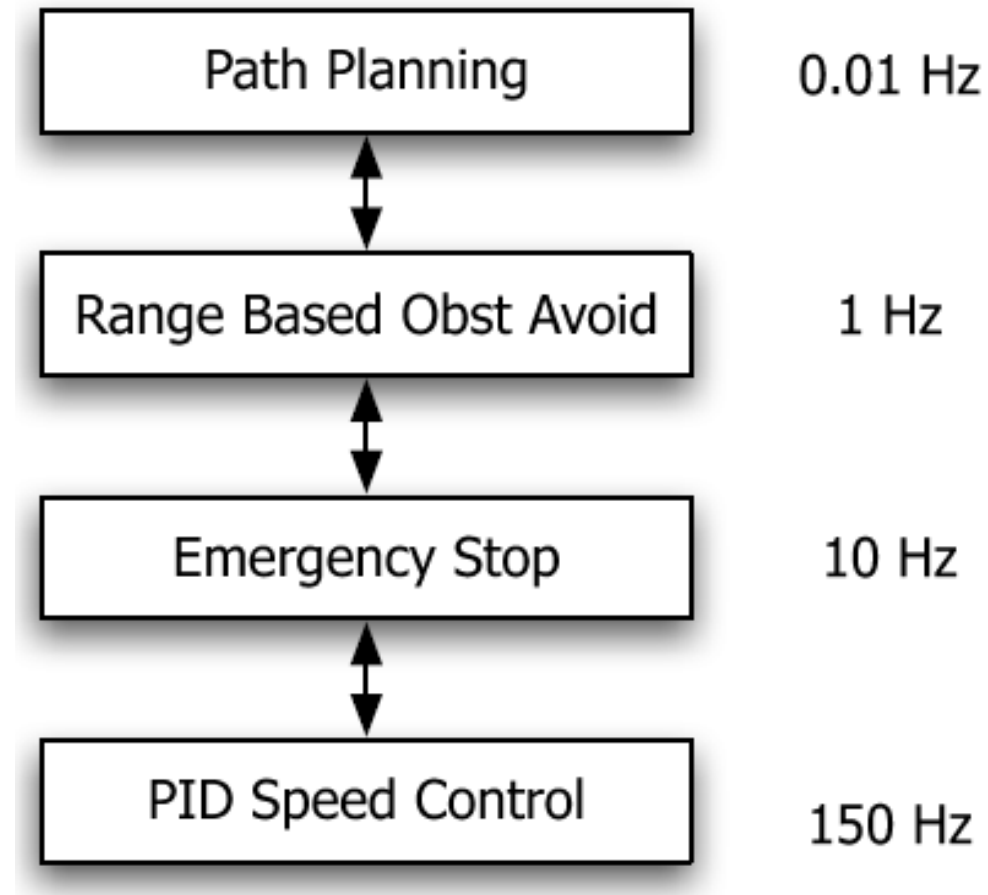

# Temporal decomposition of robot architectures

- Coarse division of control
- Layering can be loosely synchronous

# Sample Mobile Platform Decomposition

# BLG456E

Considerably adapted from work by Dr. Sanem Sariel-Talay

# Control Architecture Types (Intro)

- Deliberative
- Reactive
- Behaviour-based
- Hybrid

# Deliberative Architecture

- Maps, lots of state
- Look-ahead

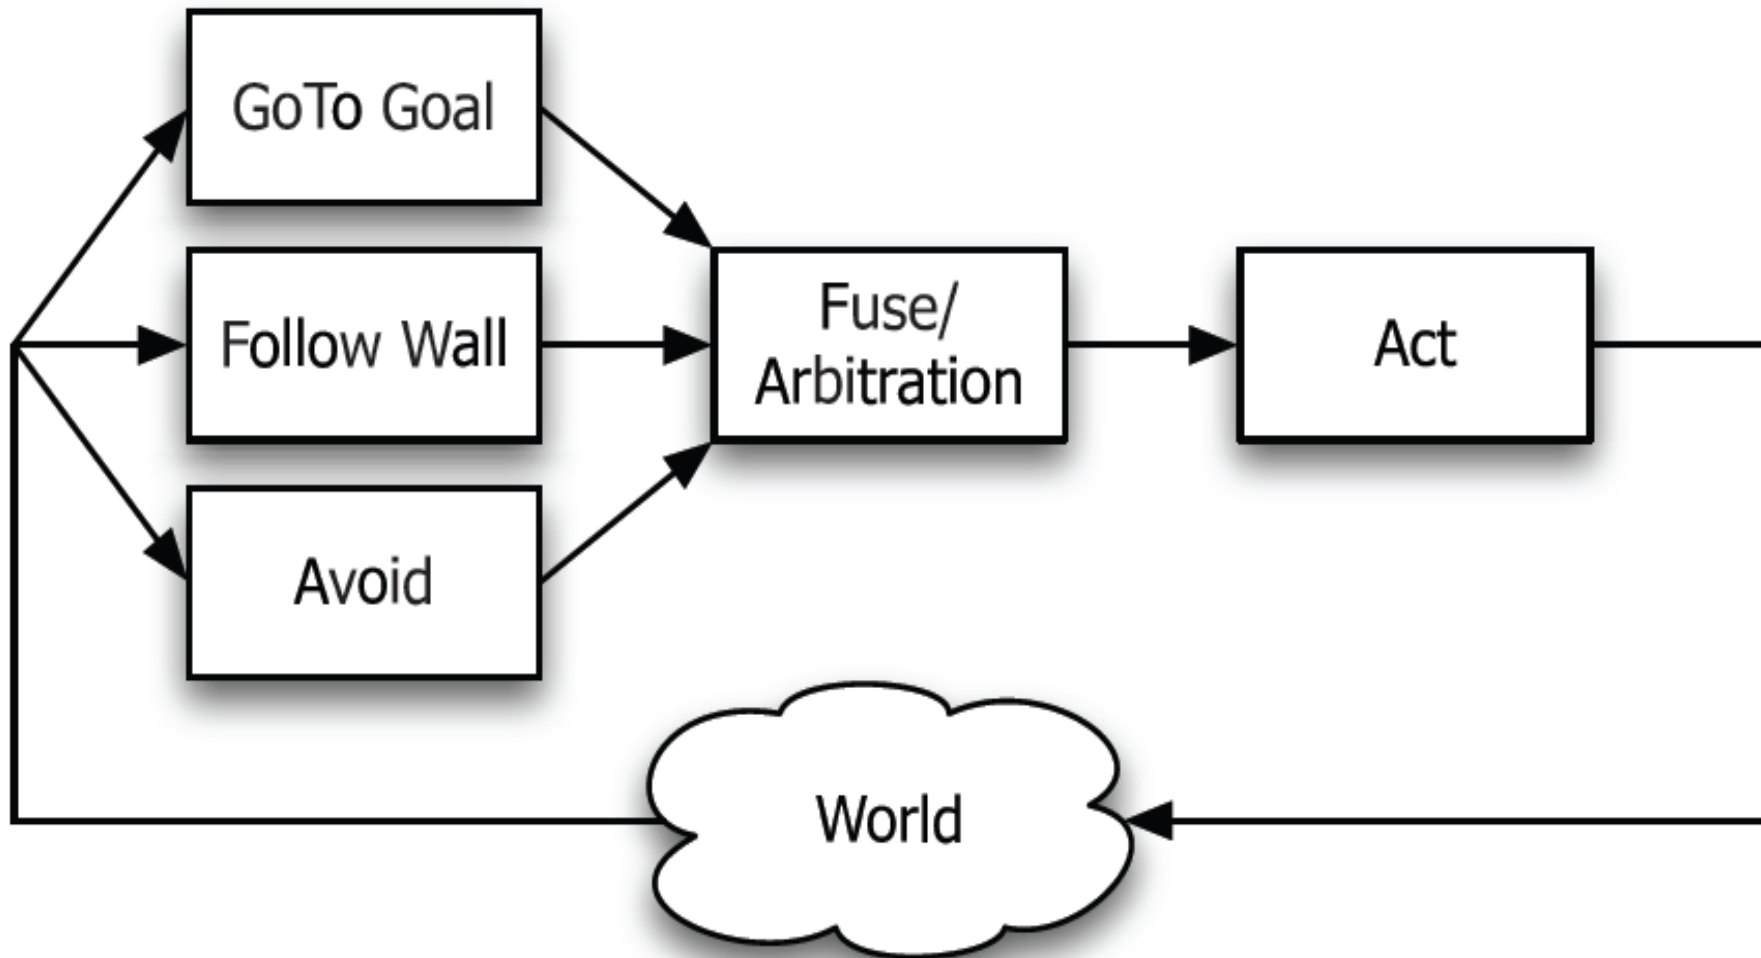

# Reactive Architecture

- No maps, no state
- No look ahead
- Could be implemented by a look-up table

# Parallel Decomposition - Behavioural

# BLG456E

# Control Decomposition: Sense-Plan-Act

# Deliberative Architecture

- Maps, lots of state
- Look-ahead

# World Modelling from Perception

`on (B, A)`  
`on (A, Table)`  
`gripped (C)`

# High-level planning: Planning problems

## **Example high-level planning problem:**

### **Initial state:**

on (B, A) , on (A, Table) , gripped (C)

### **Goal state description:**

on (A, B) , on (B, C)

## **Also need a domain description with:**

- Possible actions.
  - Action preconditions.
  - Action effects.

# Example plan

- 1 STATE: `on (B, A) , on (A, Table) , gripped (C)`  
ACTION: `put (C, Table)`
- 2 STATE: `on (B, A) , on (A, Table) , on (C, Table)`  
ACTION: `take (B, A)`
- 3 STATE: `on (A, Table) , on (C, Table) , gripped (B)`  
ACTION: `put (B, C)`
- 4 STATE: `on (A, Table) , on (C, Table) , on (B, C)`  
ACTION: `take (A, Table)`
- 5 STATE: `on (C, Table) , on (B, C) , gripped (A)`  
ACTION: `put (A, B)`
- 6 STATE: `on (C, Table) , on (B, C) , on (A, B)`  
DONE

# Domain Modelling for Action

`put (X, Y) :`

preconditions:

`-on (Z, Y)`

`gripped (X)`

effects:

`-gripped (X)`

`on (X, Y)`

# Domain Modelling for Action

`take (X, Y) :`

preconditions:

`on (X, Y)`

`- on (Z, X)`

`- gripped (V)`

effects:

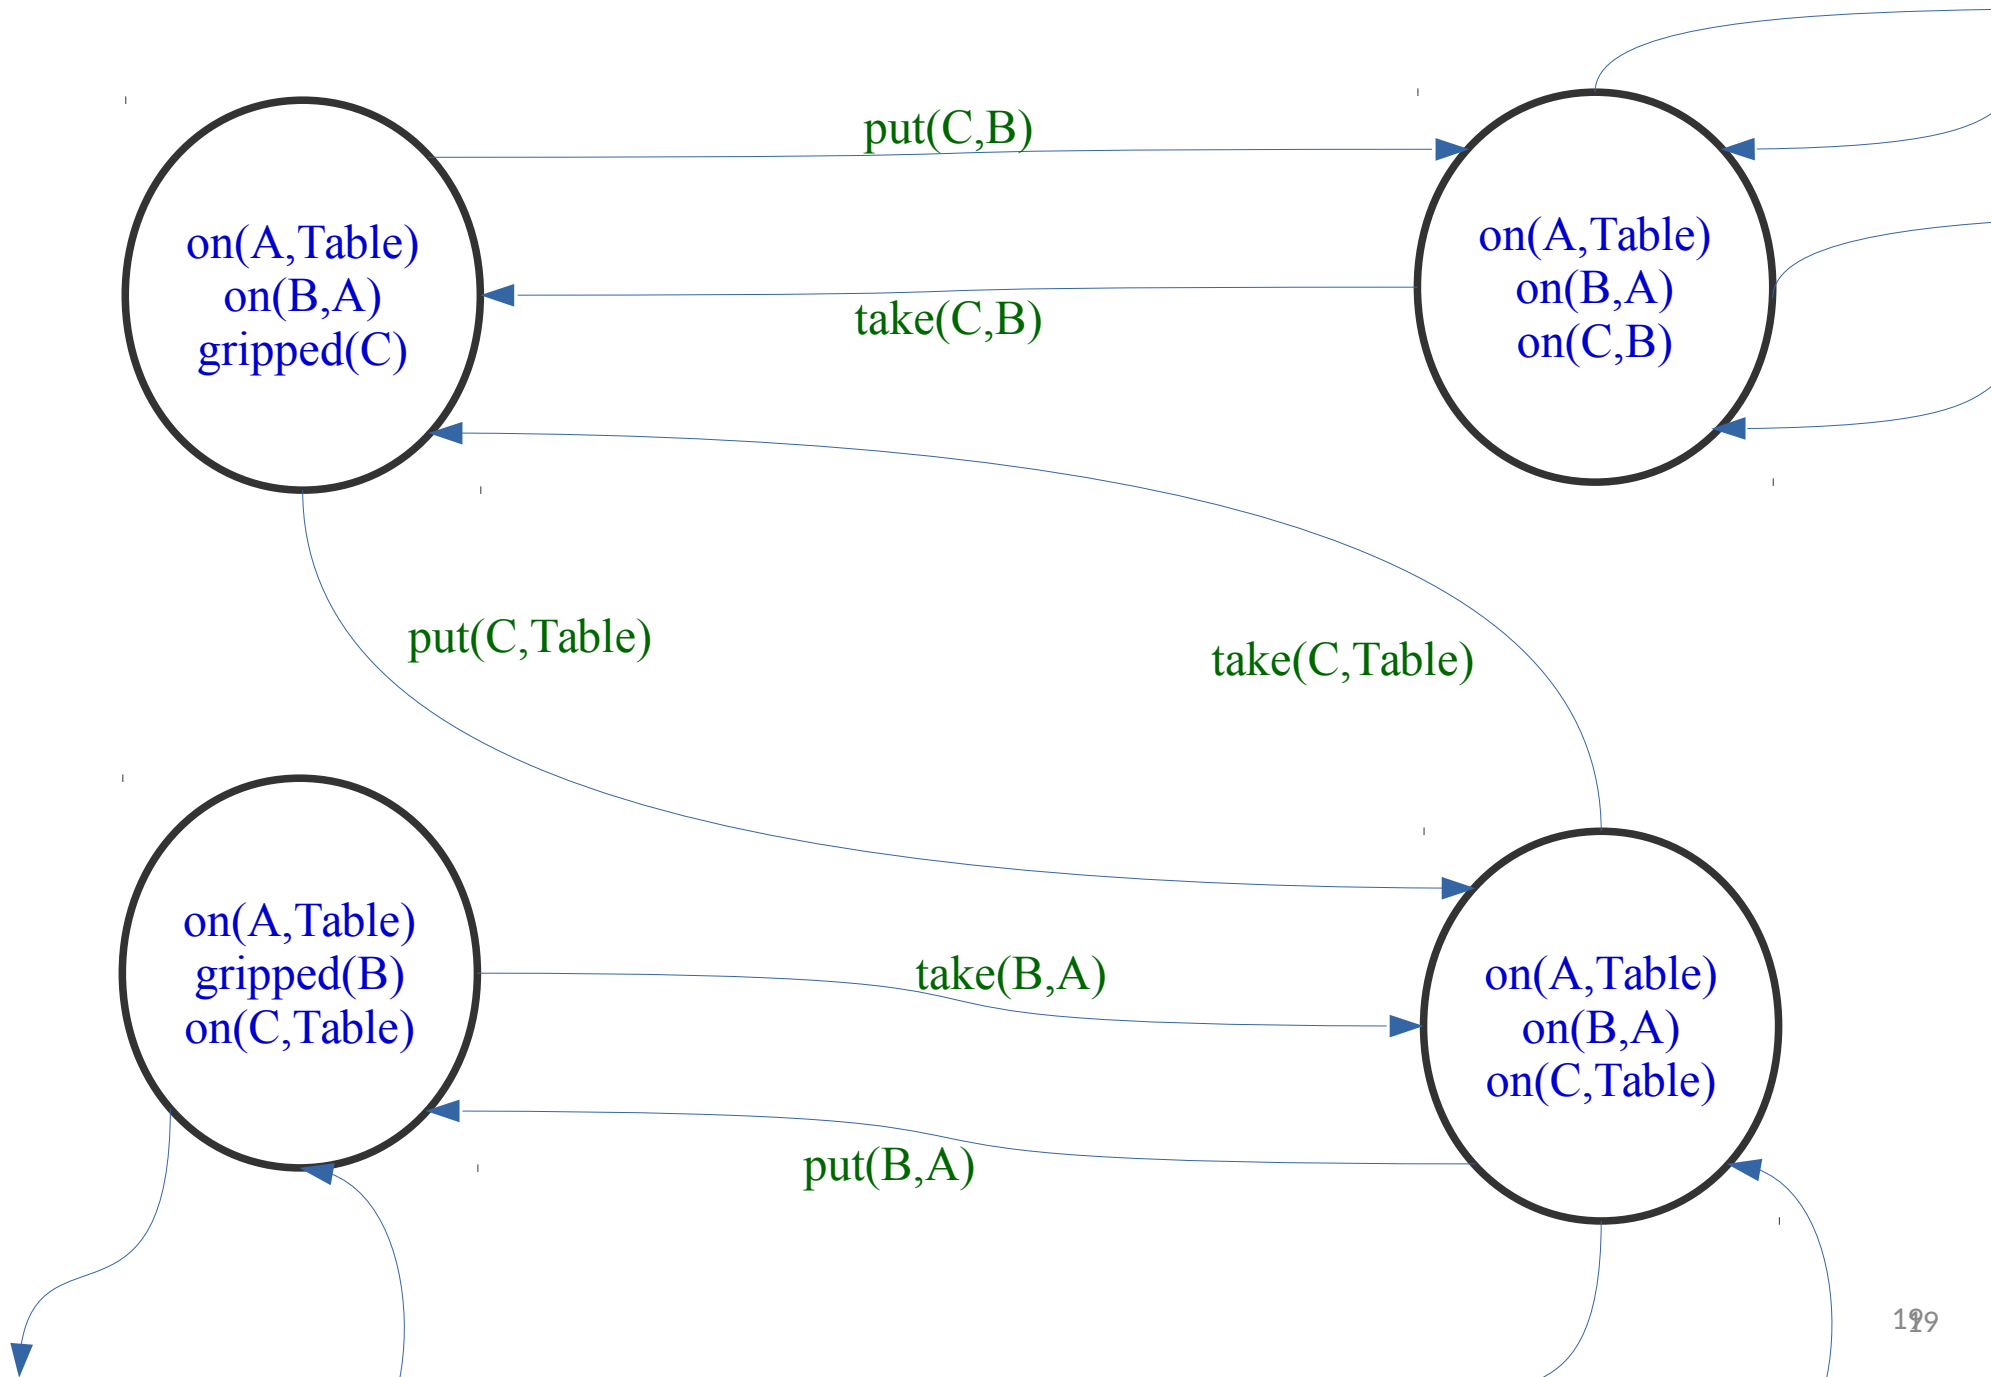

`gripped (X)`

`- on (X, Y)`

# Finding plans

- Given:
  - Domain description (available actions).
  - Goal description and initial state.
- Find:
  - Sequence of actions.
- Sample Approaches:
  - First-order logic & theorem-proving.
    - SEARCH
  - General purpose planners.
    - SEARCH (**like A\***)

# Example state subgraph

# Making planning work ( I )

- Connect with lower-levels.
- Supervisory mechanisms.

# Making planning work (II)

- Quick planning.
  - Online planning.
- Respond to changes.
  - Online planning.
  - Plan repair.
- Low level detail.
  - Human effort.
  - Semantic attachment?
  - Learning?

# Making planning work (III)

- Implement the actions.
  - Human effort.
  - Learning?
- Implement the perception.
  - Human effort.
  - Learning?
- Match model to world.
  - Human effort.
  - Learning!!

<b>Schedule:</b>	<a href="http://djduff.net/my-schedule">http://djduff.net/my-schedule</a>
<b>Coordination:</b>	<a href="http://ninova.itu.edu.tr/">http://ninova.itu.edu.tr/</a>

Considerably adapted from work by Dr. Sanem Sariel-Talay

# Reactive Architecture

- No maps, no state
- No look ahead
- Could be implemented by a look-up table

# Braitenberg Car

- By default, motors turn.
  - Sensor **inhibits** same-side motor.
- 
- Goes toward light.
  - Speeds up in dark.
  - Slows down in light.
- ↓
- Spends more time in light.

# Braitenberg Car

- Appears to have goals
- No states (current velocities).
- “loves light”.

# BLG456E

Considerably adapted from work by Dr. Sanem Sariel-Talay

# Parallel Decomposition - Behavioural

# Behaviour-based Architecture

- Combine reactive “behavioural” modules.
- Behavioural modules can have internal state.
- Behavioural modules might deliberate independently.

Combining modules does not give any guarantees of correctness (not easy to formally model)

# Layered (incremental) control: Subsumption architecture

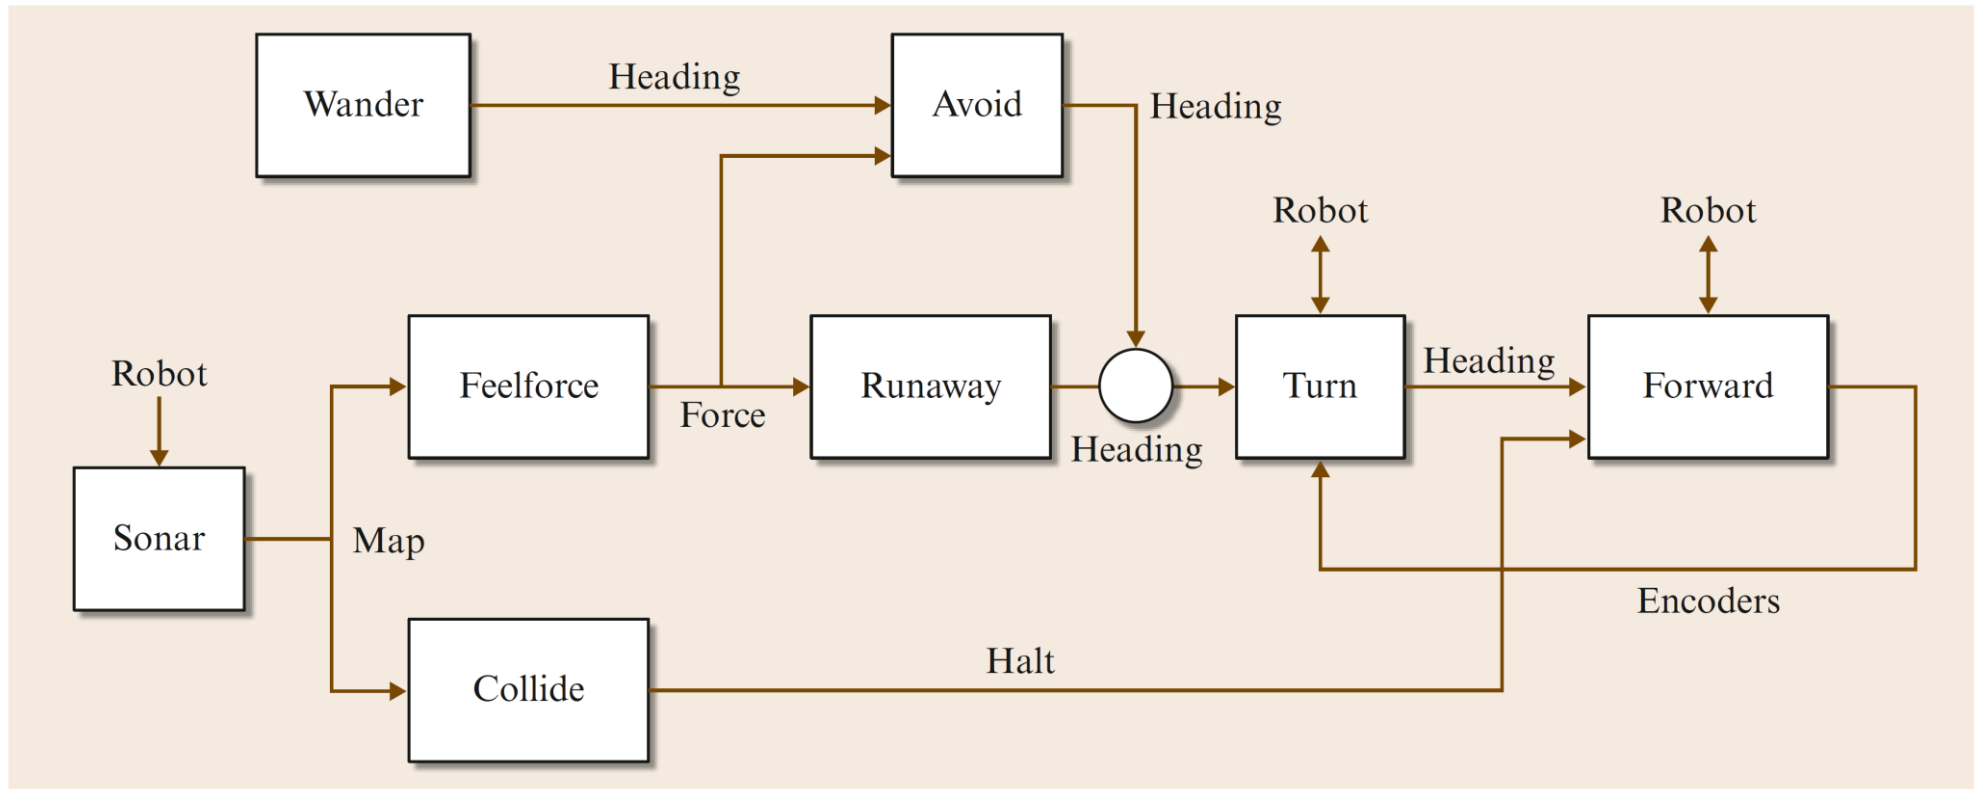

- Higher level layers **subsume** roles of lower layers (take control).
- Layers below any level form an operational control system.

# Mobile robot example

- Level 0: Avoid objects.
  - Level 1: Wander aimlessly (without hitting).
  - Level 2: “Explore”: head towards distant places.
- 
- Level 3: Build map, plan routes.
  - Level 4: Notice changes in map.
  - Level 5: Reason about objects and tasks.
  - Level 6: Formulate plans.
  - Level 7: Reason about object dynamics.

# Mobile robot example

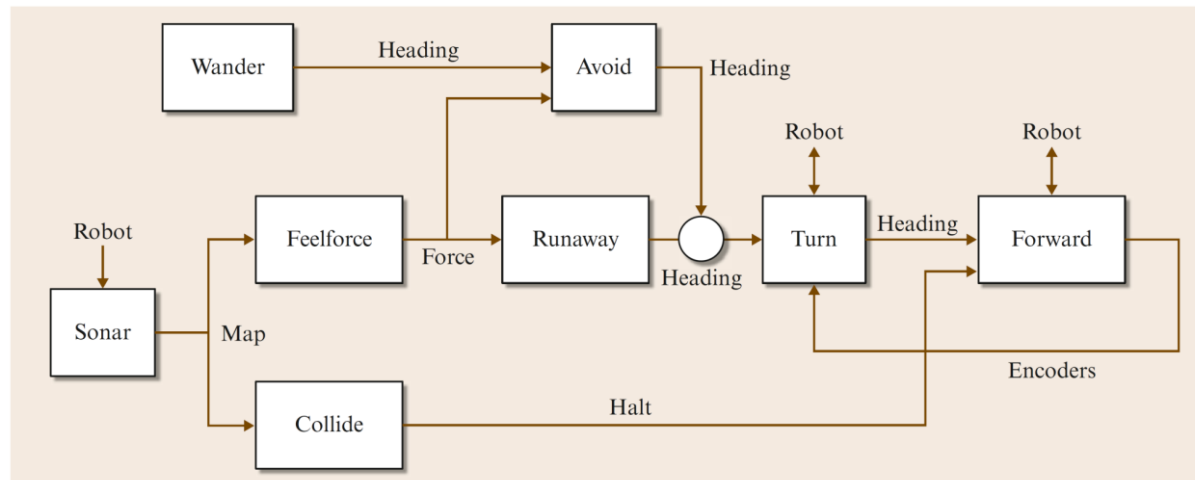

*\*Figure courtesy of Handbook of Robotics, Springer, 2008*

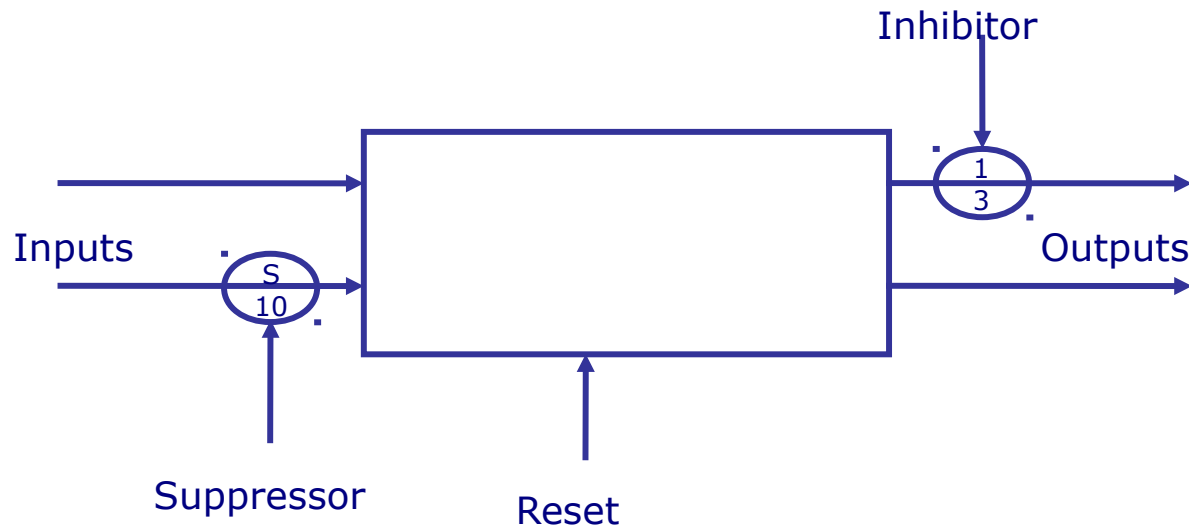

# Mobile robot example

- **sonar**: Vector of sonar readings → robot-centered **map** of obstacles.
- **collide**: Map → detects objects ahead → **halt** signal.
- **feelforce**: Obstacle map → repulsive force.
- **runaway**: Repulsive force → heading.
- **turn and forward**: Feedback control from encoders.
- **wander**: Random movement generation.
- **avoid**: Reactive avoidance: Combine feelforce and wander.

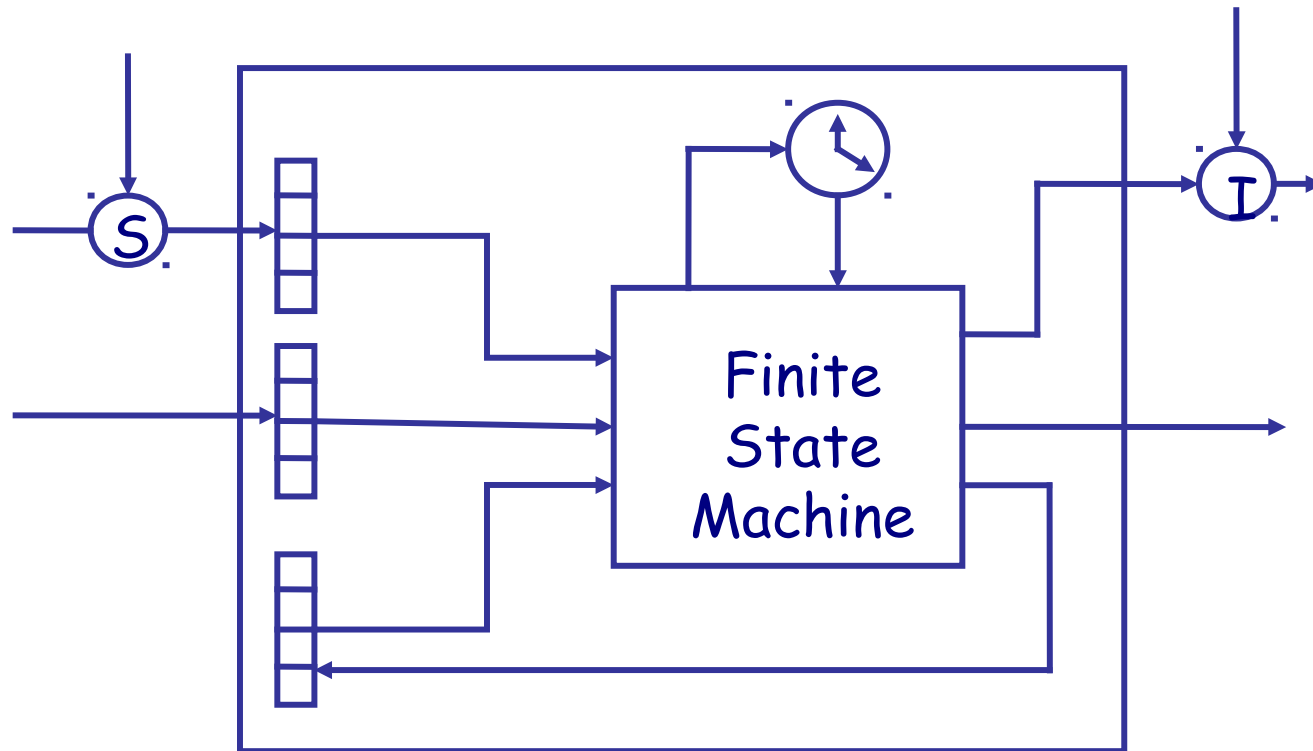

# Subsumption Modules

- Input and output lines: “wires”.
- 1-message buffer.
- Suppression of inputs or inhibition of outputs.
- Can be reset.

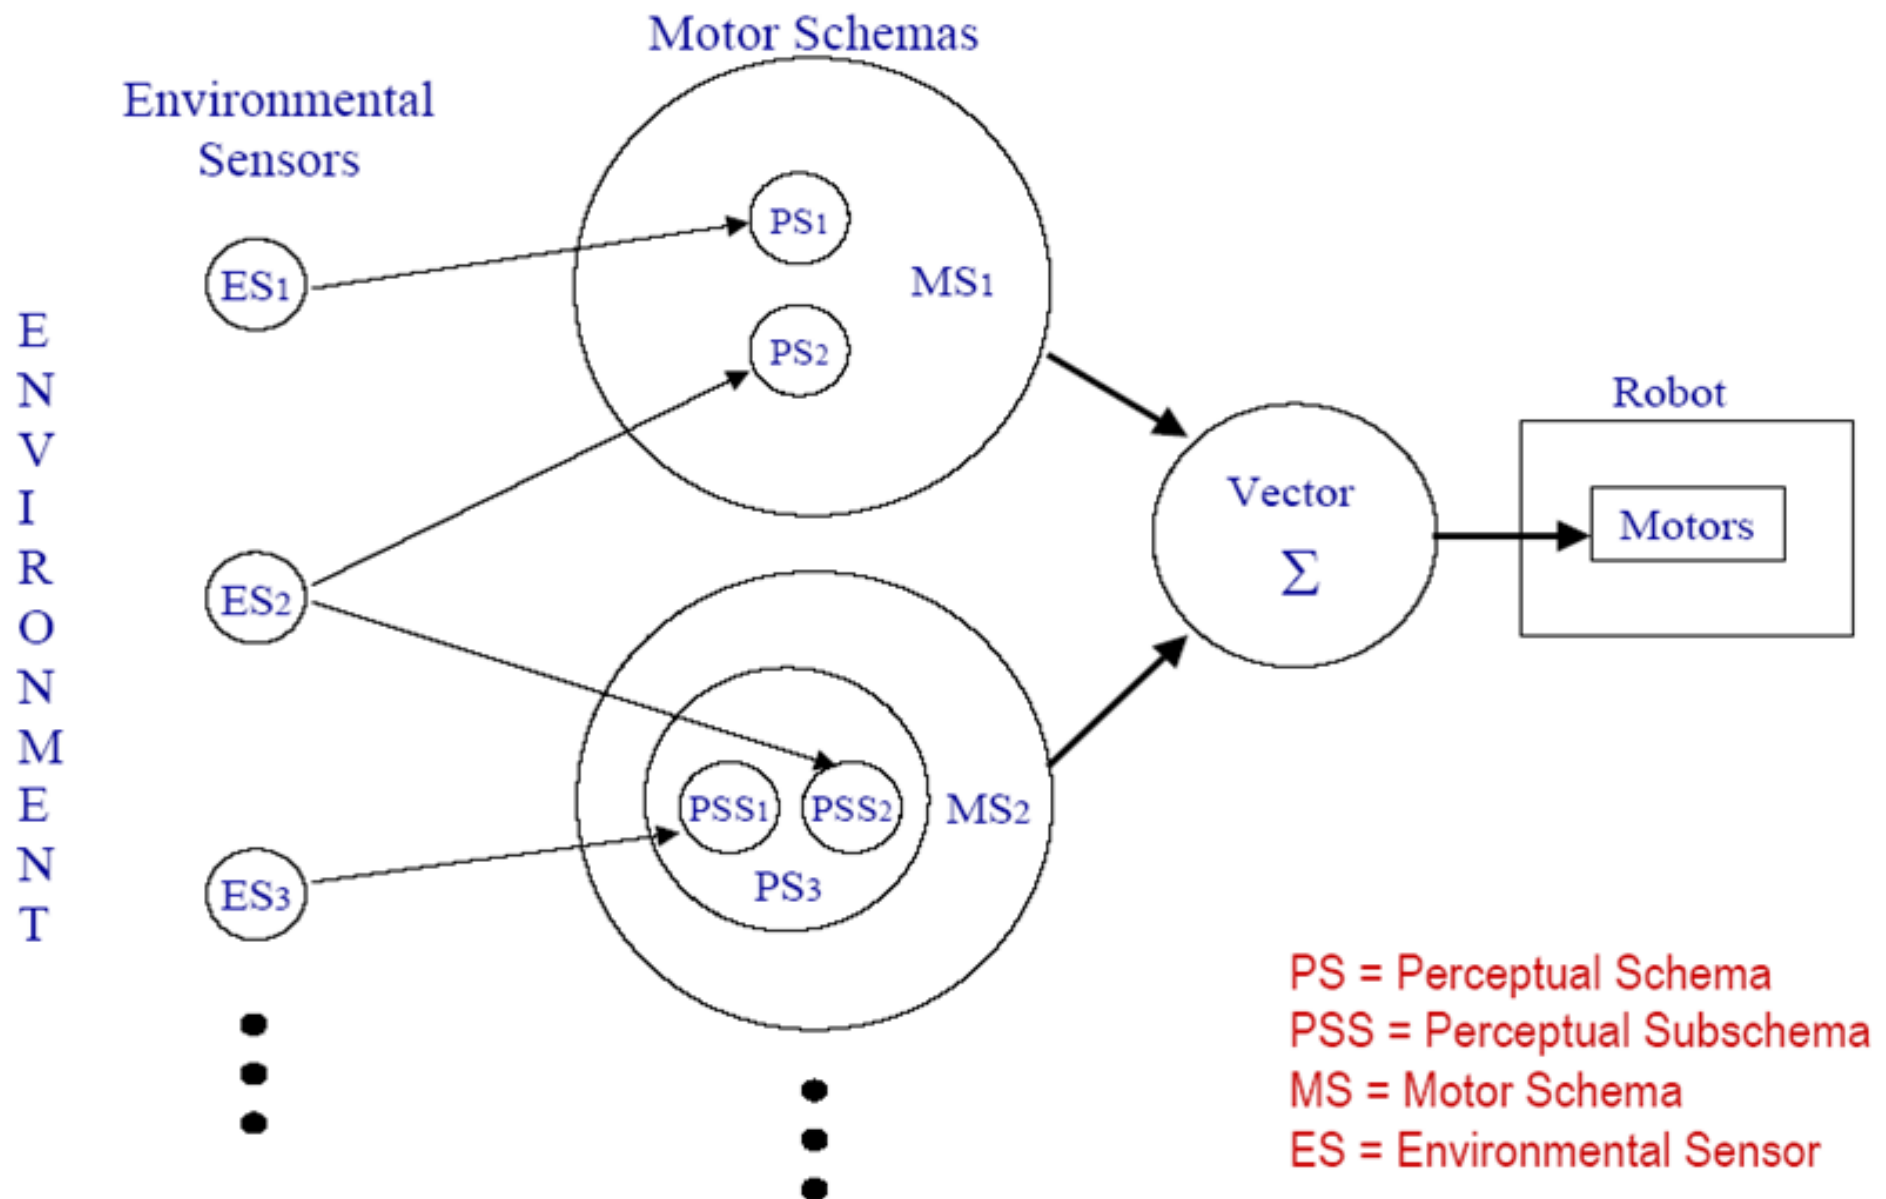

# Augmented Finite State Machines

Message arrival/timer expiration → trigger a change in the state of FSM.

# Alternative behavioural approach: Robot Schemas

# BLG456E

Considerably adapted from work by Dr. Sanem Sariel-Talay

# Hybrid Architectures

- State.
- Look ahead but react.
- Combine long and short time-scales.
- Interleaves deliberation (planning) with reactive control – e.g. moving obstacle avoidance.
- Very common nowadays.

# Hybrid Architectures

# BLG456E

# Early robots – Shakey

Shakey (SRI), 1960's

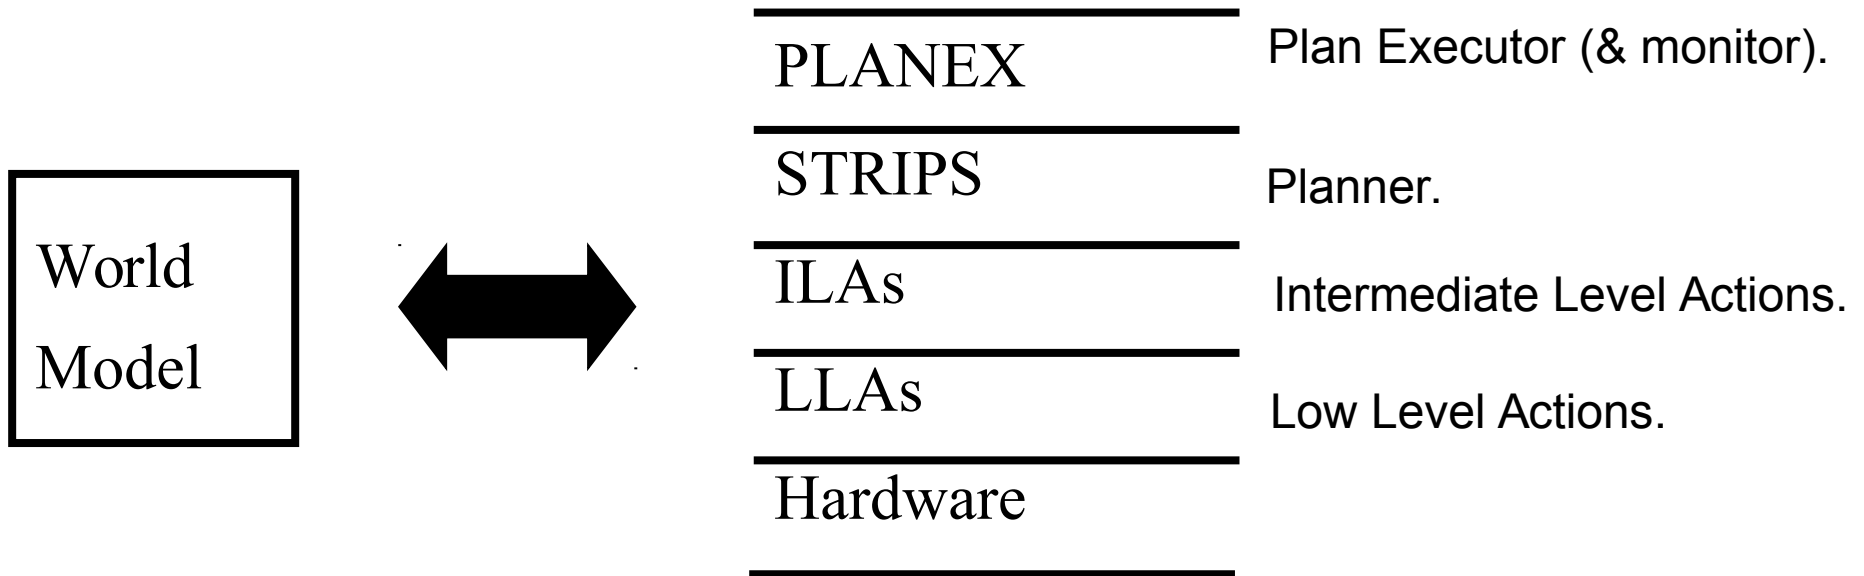

- Sensors:
  - VidiconTV camera
  - Optical range finder
  - Whisker bump sensors
- Environment: Office with specially colored and shaped objects
- STRIPS planner: developed for this system

# Shakey the robot

# Shakey outline

- Central representation (world model)
- Logic based representation.

- Components communicate via world model.
- Error recovery at several levels (e.g. plan executor, low level actions).

(strictly speaking, a hybrid approach)
