

## Computer Engineering and Me

I have always been curious about nature's and human's creations so I kept asking people around me how those things work and what they do. Even if they can't answer my questions, I could find simple answers on the internet which can only be connected by a computer.

It was obvious what computers are used for, but there wasn't any simple or complicated answer to the question of how computers work. And also computers seemed like machines that make no mistakes and create a perfect environment to think and to work. Besides all those benefits, those machines were also great entertainers. All of those created a will to develop and understand computers since I was very little. Before going to high school, I was searching about how to do different things, like setting up another OS, writing programs or changing parts of the computer. While I was in high school I learned how to build a PC and learned new information about PC parts, like CPU structure, RAM versions and their speeds, overclocking and many other things. Getting information about computers only made me thirstier for more. Then I decided to study computer engineering and I don't think so my thirst for info will end even after I graduate.

After graduation, I would like to take a job at a foreign country in the department of research and development while completing a graduate program about computers. My work might be about new subjects like artificial intelligence and big data. I also would like to keep going academically and get a doctorate. I wouldn't want to give up on learning, researching and developing even after a few years later.

I expect to finish a big project or two while working for doctorate. After doctorate I expect to have my own company to manage my works on business level. This company would do experiments and research on new fields. In fifteen years I expect that this company will be just founded and I will have a doctorate. I am hoping to work on computers and computer science for all of my life.
